

# Urban sprawl in the peri-urban areas and its surroundings, Argentina: an evaluation of the consequences on the sustainability of urban services.

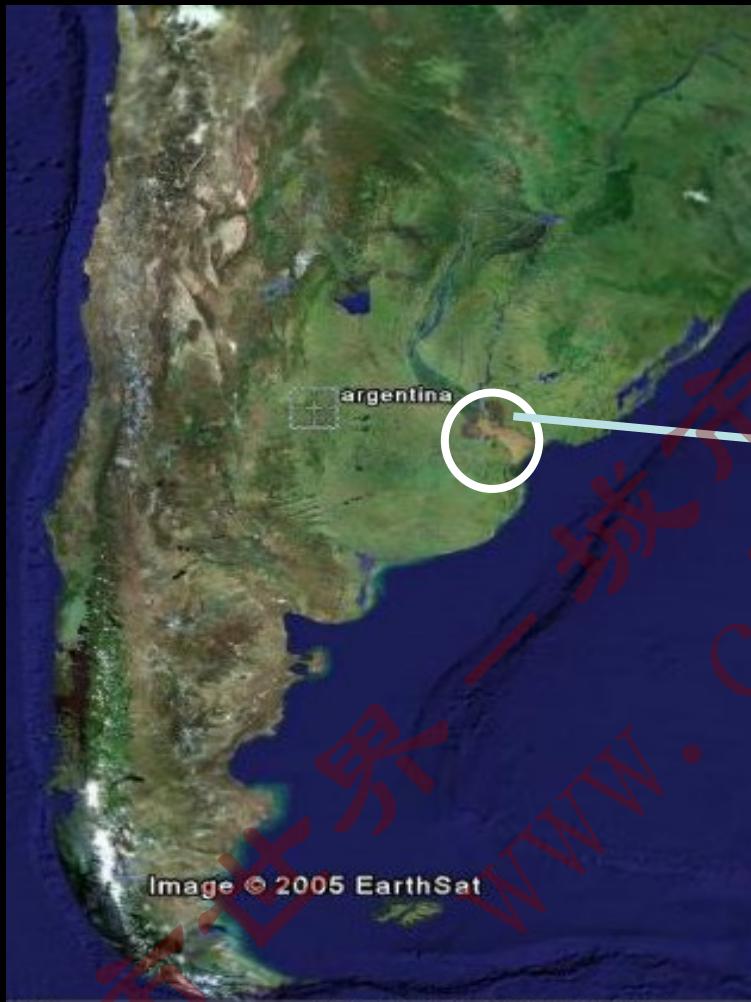

Discoli, Carlos; Martini, Irene

Urban sprawl in the peri-urban areas and its surroundings.

44<sup>th</sup> ISoCaRP Congress 2008

Unidad de Investigación N° 2 del Instituto de Estudios del Hábitat (IDEHAB),  
Facultad de Arquitectura y Urbanismo, Universidad Nacional de La Plata.  
Bs, As. ARGENTINA.

## ANALYSIS UNIVERSE

**Urban sprawl in the peri-urban areas and its surroundings**

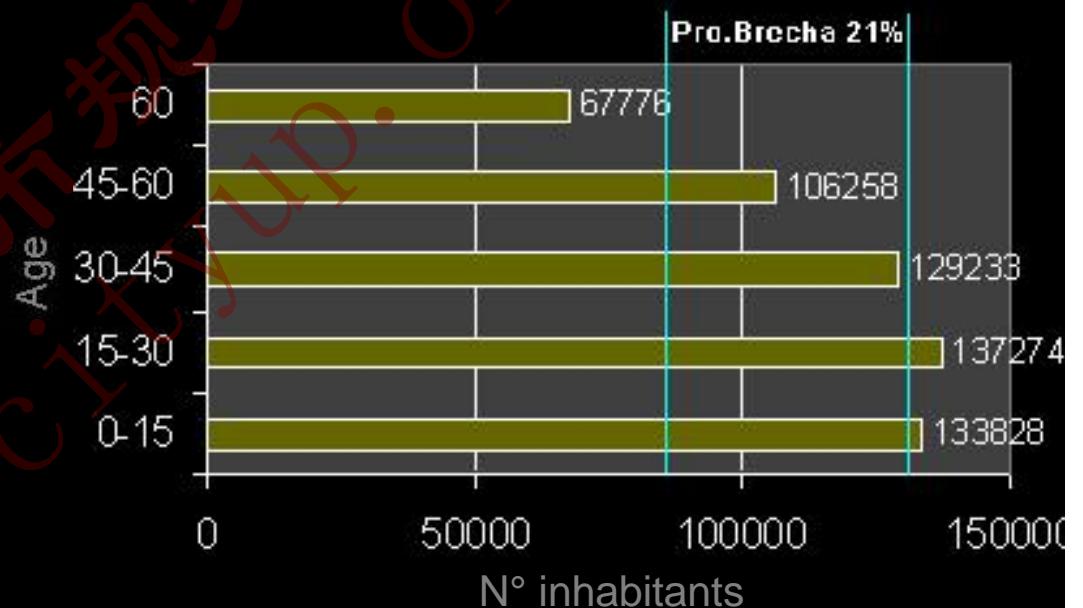

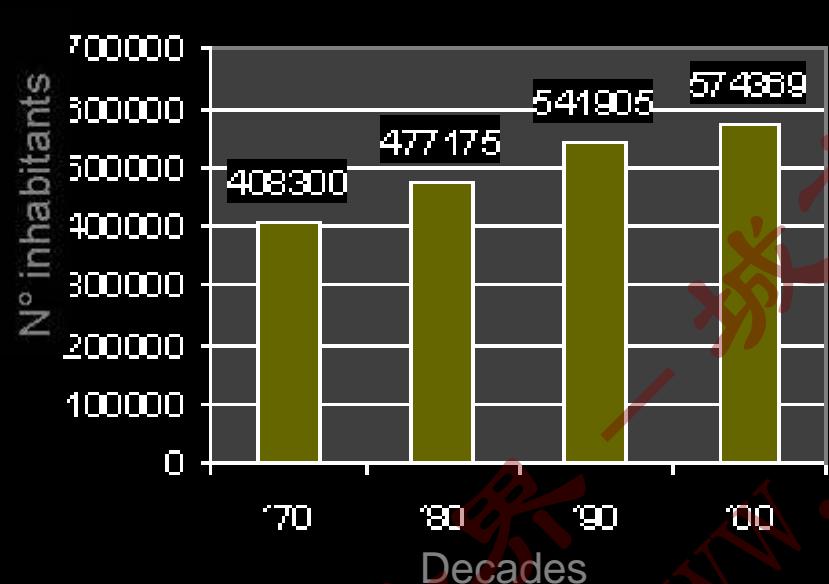

Discoli, Carlos; Martini, Irene

September 2008

## ASPECTS:

- *Residential sector*: consists on evaluating the occupation in the territory, and their evolution taking into account their growth and their energy needs;
- *Basic infrastructure services*: they are related to cover the urban energy demand (Electric power and Natural Gas), obtaining profiles represented in maps with quality levels of each service, where the offer is related through qualities that characterize it and coverings of each network with the users opinion (the demand).

## POPULATION PYRAMID, DENSITY AND GROWTH

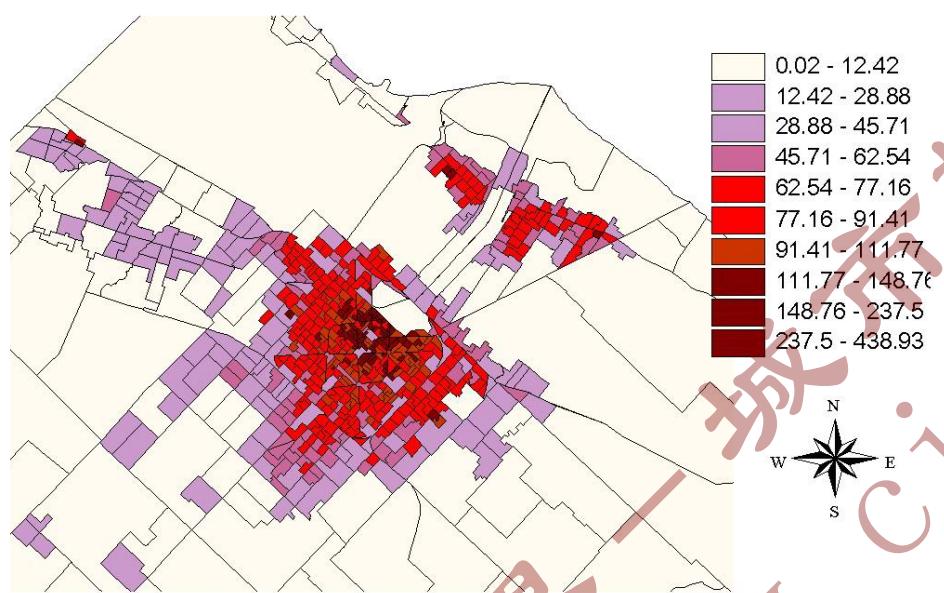

**Urban sprawl in the peri-urban areas and its surroundings**

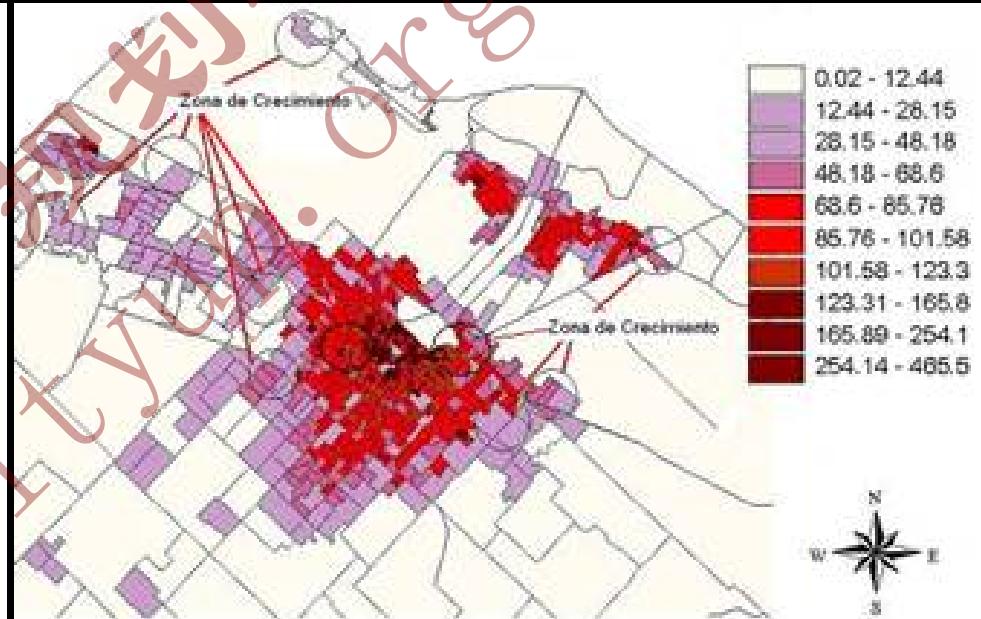

Discoli, Carlos; Martini, Irene

September 2008

## POPULATION DENSITY/Ha year 1990/2000

year 1990

year 2000

**Urban sprawl in the peri-urban areas and its surroundings**

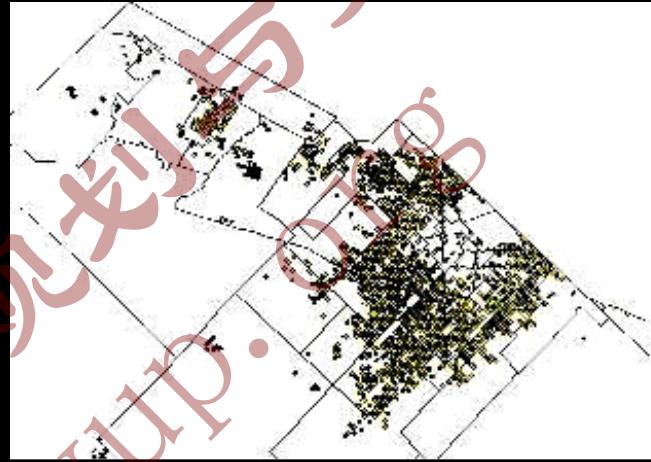

Discoli, Carlos; Martini, Irene

September 2008

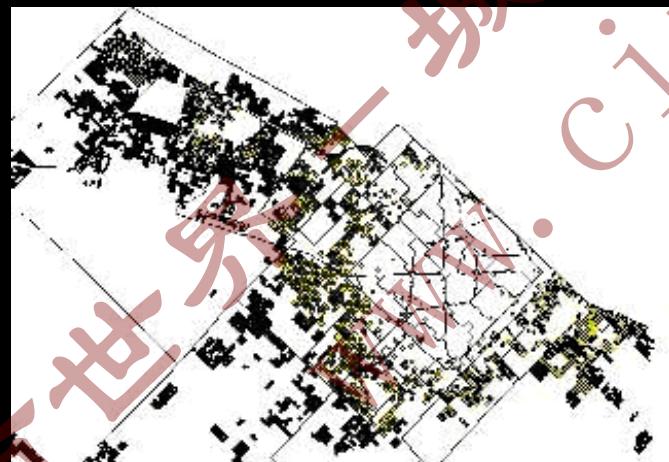

## URBAN CONSOLIDATION

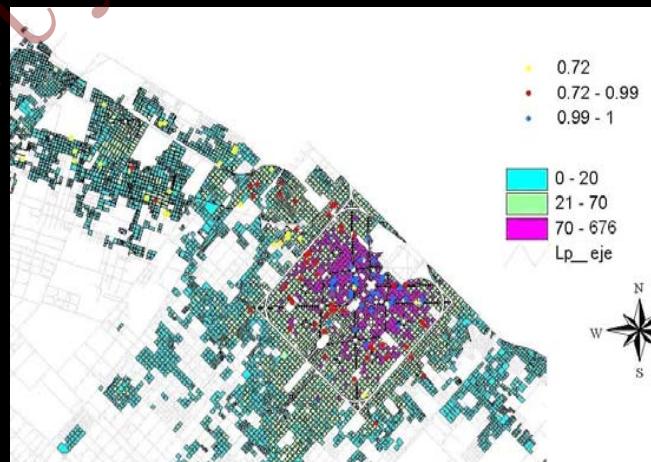

High consolidation: More than 70 houses per block.

Medium consolidation: Between 70 and 21 houses per block.

Low consolidation: Less than 20 houses per block.

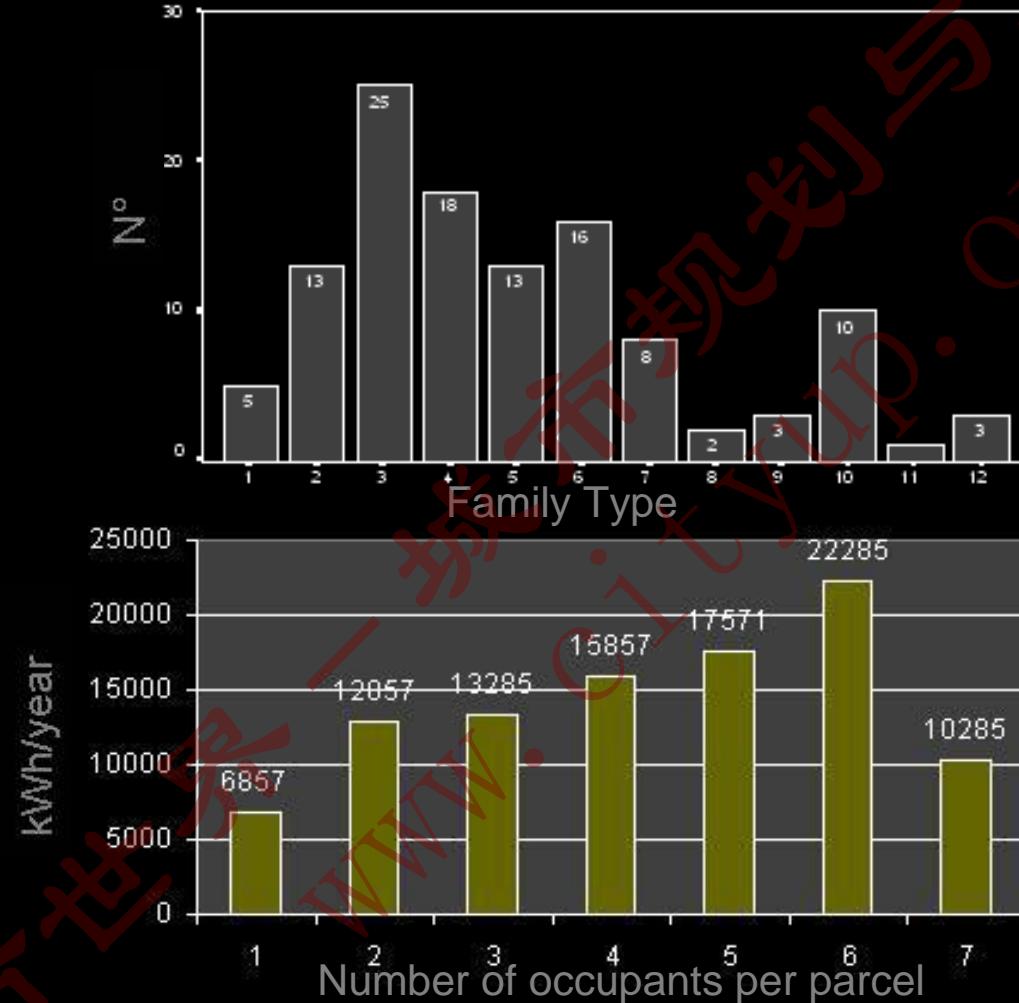

Consolidation Integration and surveyed homes

## CONCLUSIONS

The obtained results show:

- that the proposed methodology is effective as for the evaluation of the urban sectors and their services;
- sensibility resolution as for the obtaining of qualified information as to the conformation of descriptive homogeneous areas of each situation;
- urban equity and inequity tendencies in each valued areas, and their limits respond to the precision and localization of the primary information;

- that the foreseen tools (indexes, profiles, maps) allow us to locate the behavior tendencies of each infrastructure service (Ep and NG) in quality terms, to verify and to identify different aspects taking into account the significant participation of the demand (users) through the opinion and to establish urban vulnerability scales;
- for each energy service the first quality profiles;
- the possible to locate in the territory the inequalities taking into account the homogeneous areas identification.

- that the variable disintegration of each one can be compared with population's maps and with the consequent inhabitants' energetic demand in a same urban area;
- coincidences among those sectors that register inequities in their offer can be verified with those that register population's growths and not foreseen demands;
- that the existent network, many of them to the limit of its loads, present different supply problems, affecting the offer of each service;
- that urban sprawl will continue collapsing the energy services in their more vulnerable areas, stressing the necessity to analyze in the future the possible attractors, in order to know with more precision the growth tendencies and to begin to plan the offer.
